1 Introduction

Sound has become of increasing concern in the industry. Bosch has invested in a state of the art sound test facility to test our products according to the AHRI standard 260-2017 and what, if any, impact changes to the design may have on the unit sound spectrum.

It is important to understand the difference between Sound Power and Sound Pressure in the evaluation of the impact the Water Source Heat Pump will have on the occupied space.

1.1 Sound Power

Sound power is the energy radiated from the source, in this case the heat pump. The energy is radiated directly from the source and the acoustical characteristics of the space are not taken into account. Sound power is the base measure used by the engineer as the starting point to determine the resultant sound in the conditioned space. Building materials have acoustic characteristics that define the sound attenuation and enable the engineer to predict sound pressure levels in the conditioned space. So to sum up sound power is the basis for an acoustical evaluation of the sound that will be heard in a space.

All Sound Components are tested utilizing either a reverberation room (qualified by test) or using Sound Intensity. Reverberation room tests are conducted using the Comparison Method and a calibrated Reference Sound Source, while the sound intensity tests are conducted using measurements made at discrete points or by the scanning method. Sound ratings are in the form of octave band Sound Power Levels (dB) from 63 to 8000 Hz derived from one-third octave band measurements.

This sound measurement is the 'purest' since it does not include any assumptions for room size or furnishings.

1.2 Sound Pressure

Sound pressure is a measure of the dynamic pressure that causes local pressure fluctuations in the air molecules. These fluctuations can be measured in Pascals (Pa) or when expressed in decibels (dB) the term is known as Sound Pressure Level. This pressure is what is measured by a microphone or perceived by our ear drums.

The sound pressure is depend upon the nature of the space volume, furnishings and surface treatment. The design engineer's challenge is to convert Sound Power, taking into consideration the nature of the room, to predict Sound Pressure. Sound pressure levels are the measure used when trying to determine the resultant effects of the operating equipment on the conditioned space.

The sound pressure can be estimated for any room using the sound power levels, room volume and surface furnishing. The sound pressure can also be easily measured using simple equipment.

1.3 About AHRI 260 Sound Ratings

In 2001 ARI 260-2001 Sound Rating of Ducted Air Moving and Conditioning Equipment established the procedure for determining the sound power ratings for Water Source Heat Pumps. This standard has been updated multiple times and is now AHRI 260-2017.

The AHRI 260 provides test procedures and rating criteria for 5 configurations of the Water Source Heat Pumps:

- Ducted Inlet
- Casing Radiated
- Free Inlet
- Free Inlet/Casing Radiated
- Ducted Discharge

The most common configurations for the Water Source Heat Pumps are "Casing Radiated" & "Ducted Discharge".

Casing radiated sound power represents the sound a person would hear if they were standing directly in front of the unit. Ducted discharge sound power levels represent the sound a person would hear through air vents in a room when the heat pump is installed elsewhere.

The following tables present the Sound Power of the different series offered by Bosch. The data includes both the Casing Radiated and Ducted Discharge for horizontal and vertical units. As required in AHRI 260-2017 sound power in the 63 through 8000 Hz bands are presented. The 63 Hz sound power has a significant effect in the total sound power from a unit. It is therefore important when comparing sound power from different units that this frequency is included in the overall total. Additionally, all data presented in the following tables was collected at the AHRI rated CFM and static pressure for each unit.

1.4 Sound Attenuation Package

Bosch offers a sound reduction package for projects where a lower sound level is a requirement. This package includes a compressor blanket and close cell foam insulation.

1.5 Correction Factors

Correction factors are needed to adjust the frequency band by accounting for the loss of acoustical energy through the acoustical test duct during transmission to the test space. This is done so that the sound power presented is representative of what would be transmitted into a non-reflecting duct system. In accordance with AHRI 260, the correction factors listed within this document include a duct end correction and an acoustic test duct elbow correction. The ducted discharge data in the following sound power data tables already has the correction factors applied, and is not the raw data. The specific correction factors used can be found in the tables below.

For reference see 2019 ASHRAE Applications Handbook, Section 49, page 49.24
Table 24.

Ducted Discharge Correction Factors - All Other Models								
1/3rd Octave band	50	63	80	100	125	160	200	250
Adjustment factor	9.841	1.777	1.185	0.794	1.525	1.328	1.213	4.137
1/3rd Octave band	315	400	500	630	800	1000	1250	1600
Adjustment factor	4.087	4.054	7.035	7.022	7.014	7.009	7.006	7.003
1/3rd Octave band	2000	2500	3150	4000	5000	6300	8000	10000
Adjustment factor	7.002	7.001	7.001	7.001	7.000	7.000	7.000	7.000

Table values may vary slightly depending on unit configuration, model, and test setup.

NOTES:

1) Sound tests are performed at 0.1-.2 external static based on capacity of the units to align with ARI 600 "Performance Rating of Water/Brine to Air Heat Pump Equipment" as well as DOE proposed rulemaking both expected to be released in 2024.

2) Sound ratings for all sizes based on constant airflow motor option

3) Sound based on standard refrigerant option. No Hot Gas Reheat. No economizer.

NOTES:

1) Sound tests are performed at 0.1-2 external static based on capacity of the units to align with ARI 600 "Performance Rating of Water/Brine to Air Heat Pump Equipment" as well as DOE proposed rulemaking both expected to be release in 2024.

2) Sound ratings for model sizes 007, 009, 012 based on constant torque motor option

3) Sound ratings for model sizes 015, 018, 024, 030, 036, 042, 048, 060, 070 based on constant airflow motor option

4) Sound based on standard refrigerant option. No Hot Gas Reheat. No economizer.

NOTES:

1) Sound tests are performed at 0.1-2 external static based on capacity of the units to align with ARI 600 "Performance Rating of Water/Brine to Air Heat Pump Equipment" as well as DOE proposed rulemaking both expected to be release in 2024.

2) Sound ratings for model sizes 007, 009, 012 based on constant torque motor option

3) Sound ratings for model sizes 015, 018, 024, 030, 036, 042, 048, 060, 070 based on constant airflow motor option

4) Sound based on standard refrigerant option. No Hot Gas Reheat. No economizer.
